Claims 1-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over applicants' statement of the prior art.

Applicants acknowledge in their specification that stick preventative agents are conventionally employed in thermal receiver elements in order to produce better images. The particular stick preventative agents recited in the claims appear to be acknowledged by applicants as known materials for the function of reducing undesired sticking. The experimental modification of these prior art stick preventative agent-containing thermal receiver elements in order to ascertain optimum-operating conditions (e.g., determine coating amounts) fails to render applicants' claims patentable in the absence of unexpected results.

Claims 1-18 are provisionally rejected under the judicially created doctrine of double patenting over claims 1 and 12 of copending Application No. 10/729,215. This is a provisional double patenting rejection since the conflicting claims have not yet been patented.

The subject matter claimed in the instant application is fully disclosed in the referenced copending application and would be covered by any patent granted on that copending application since the referenced copending application and the instant application are claiming common subject matter, as follows: the print assembly of SN 10/729,215 includes a receiver that employs the same stick preventative agent as that recited in the instant claims.

Art Unit: 1774

Furthermore, there is no apparent reason why applicant would be prevented from presenting claims corresponding to those of the instant application in the other copending application. See *In re Schneller*, 397 F.2d 350, 158 USPQ 210 (CCPA 1968). See also MPEP § 804.
